

TU Dresden | Winter semester

Prediction and Estimation Techniques

Tutor: [Waltenegus Dargie](#)

In this lecture random variables, probability density functions, and various probabilistic estimation techniques such as minimum mean square estimation and Kalman Filter will be discussed. The lecture materials, including videos, are available directly from the TU Dresden's website. Some of the videos are accessible from YouTube.

Deutsch WiSe26/27

Tutor: [Sprachen Zentrum](#) | [Monika Rusz ](#)

TU Dresden | Winter semester

Software Engineering for Self-Aware Systems And Cobotics (SESAC) (WS26/27)

Tutor: [Uwe A mann](#) | [Oliver Geisel](#)

This course introduces self-aware, self-adaptive, self-optimizing software systems, with the application area co-working robotics (cobotics).

TU Dresden | Winter semester 2026 / 2027

Behind the Secrets of Large Language Models (WiSe 26/27)

Tutor: [Simon Razniewski](#) | [Yujia Hu](#) | [Luca Giordano](#) | [Himanshu Manoj Kaloni](#) | [Elza Shakirova](#)

Fakult t Informatik / P. Distributed and Networked Systems | Winter semester 2026 / 2027

Advanced Computer Networks (WS 26/27)

Tutor: [Matthias W hlisch](#)

This lecture provides insights into practical aspects of computer networks and presents emerging and future trends in network and protocol engineering. After this course, you will better understand how (large) network and service operators run their network, why original design concepts were not implemented, and why not all deployments contribute to a better Internet.

Model Checking

Tutor: [Timm Spork](#) | [Johannes Alexander Lehmann](#) | [Andrea K hn](#) | [Sascha Kl ppelholz](#)

Fakult t Informatik / P. Distributed and Networked Systems | Winter semester 2026 / 2027

Internet Measurements (WS 26/27)

Tutor: [Matthias W hlisch](#)

The lecture provides an introduction to concepts and tools for Internet measurements. In addition to basic concepts, we focus on the question how the Internet core and applications and services on top look like in real deployment. Using concrete examples, we illustrate how to measure common and emerging communication solutions (e.g., BGP, IPv6, DNSSEC).

TU Dresden | Winter semester 2026 / 2027

High Performance Computing WiSe2026/27

Tutor: [Robert Schöne](#) | [Markus Velten](#) | [Josef Weidendorfer](#)

Attention: we may update this course from time to time, for which it has to be restarted. If necessary, we will perform these activities between 3pm and 5pm. During this time interruptions may occur. Please excuse the inconvenience this may cause.

Design Patterns and Frameworks (WS26/27)

Tutor: [Sebastian Götz](#) | [Christian Gutsche](#)

Software development problems have a tendency to reoccur in different projects. Thus, one way to increased efficiency in developing software is increased reuse of solutions previously developed. Very often, however, problems repeat in a similar, but not exact manner, making code reuse hard to impossible. Patterns are the way out of this problem. They allow the

Distributed Systems (WS 26/27)

Tutor: [Thomas Springer](#)

The course covers fundamental problems, concepts, and solutions of Distributed Systems. It discusses architectural principles, engineering concepts as well as established technologies, services, and standards. After completing the course, the student should be able to analyze the requirements of a distributed application and convert this analysis into a practical
